Short-Term Forecast Discussion

- We continue to favor today as an overall dry day, however an isolated pocket of precip will be possible in the 12 – 3P window. We'd favor any isolated activity to stay N and W of our stations, but the chances are not 0%.
- Winds will continue out of the SE at ~10-15 MPH sustained, gusting at times up to 15-20 MPH.
- Highs look to sit in the lower 80s, mid to upper 80s inland.
- *No fog expected today.*

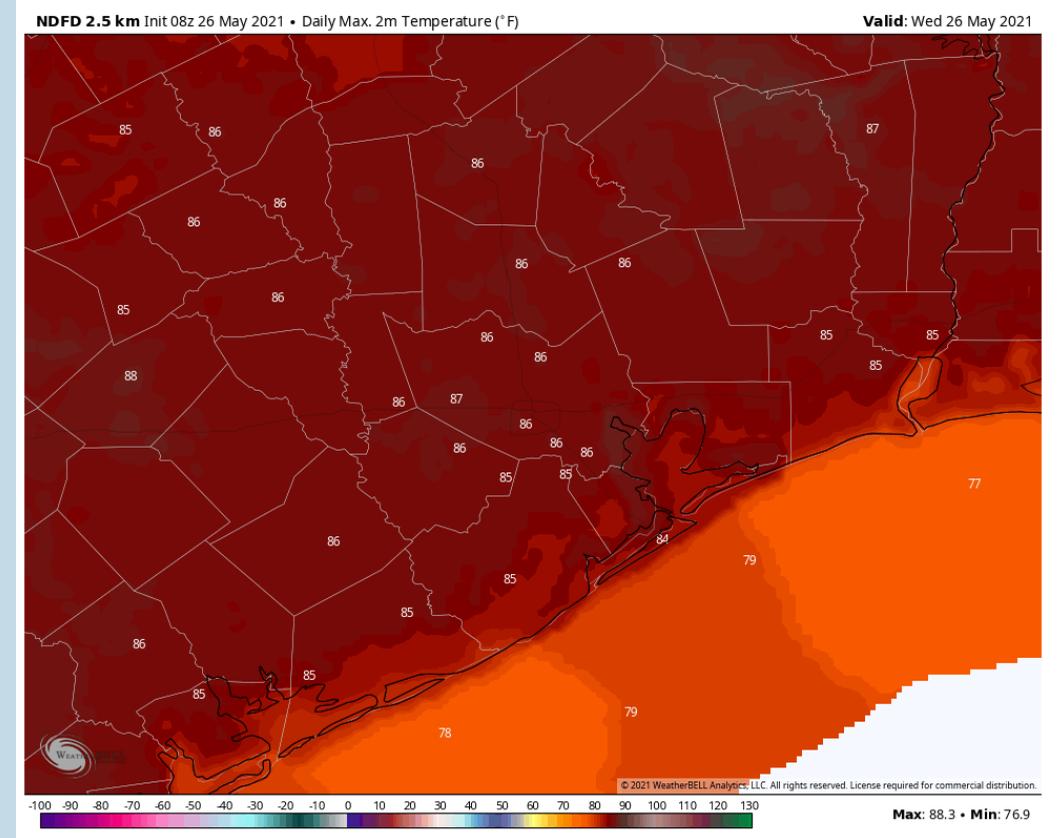

Sustained Winds (1 PM CT)

Simulated Radar Snapshot (2 PM CT)

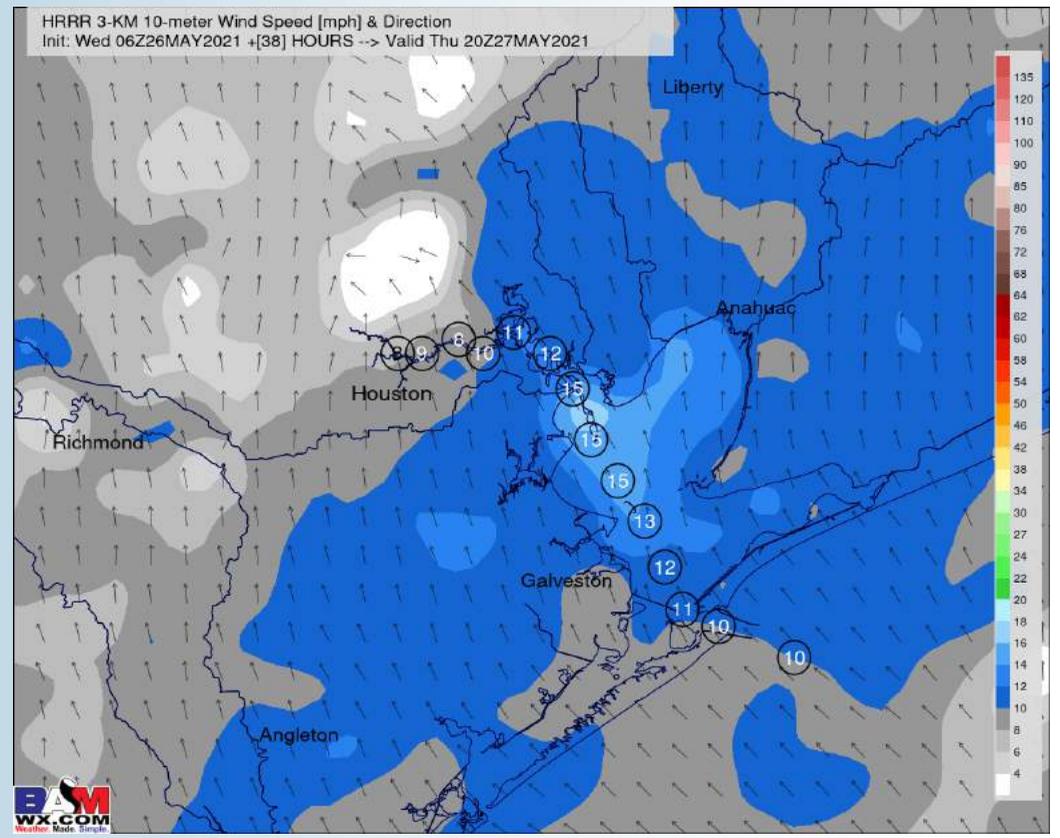

High Temperatures Today

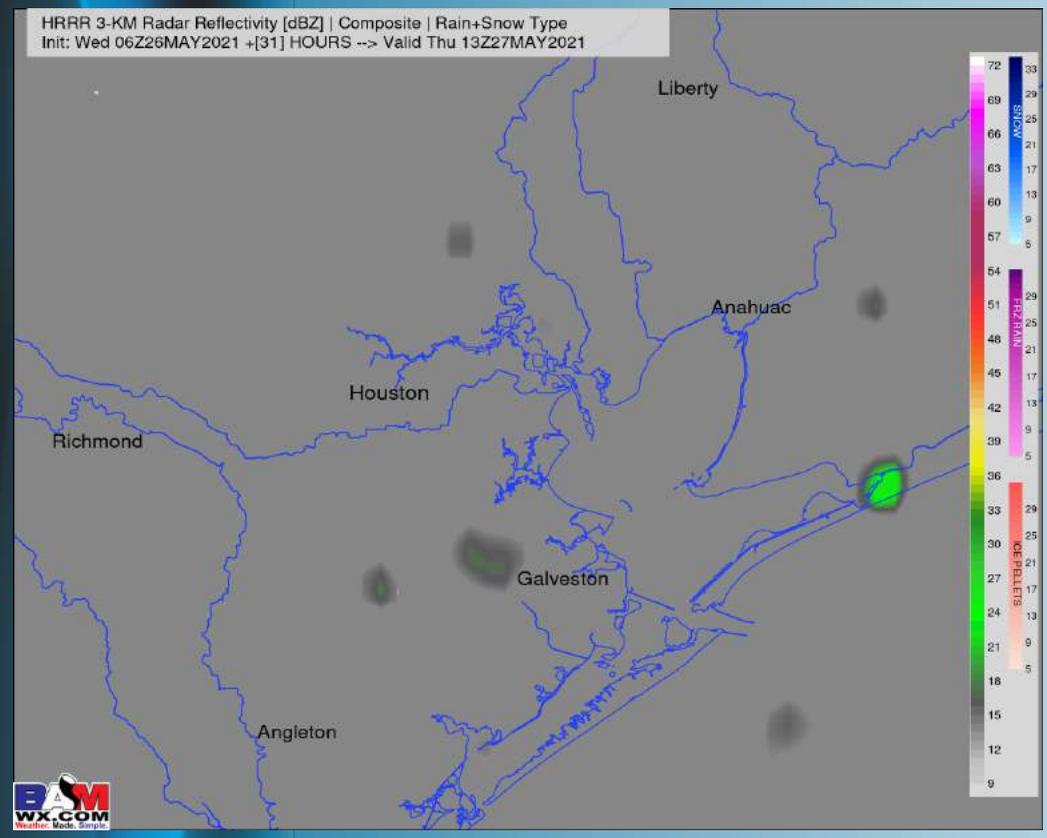

Short-Term Forecast Discussion

- Thursday looks like an overall drier day as well at this distance. An isolated shower / t'storm cannot be fully ruled out in the mid AM to mid-PM window, but chances continue to look quite low.
- Winds on Thursday will continue out of the SSE at ~10-15 MPH sustained. A brief period after sundown may feature locally elevated winds for a few hours before returning back to 10-15 MPH.
- Highs will once again be in the lower 80s, much warmer inland.
- *No fog expected on Thursday.*

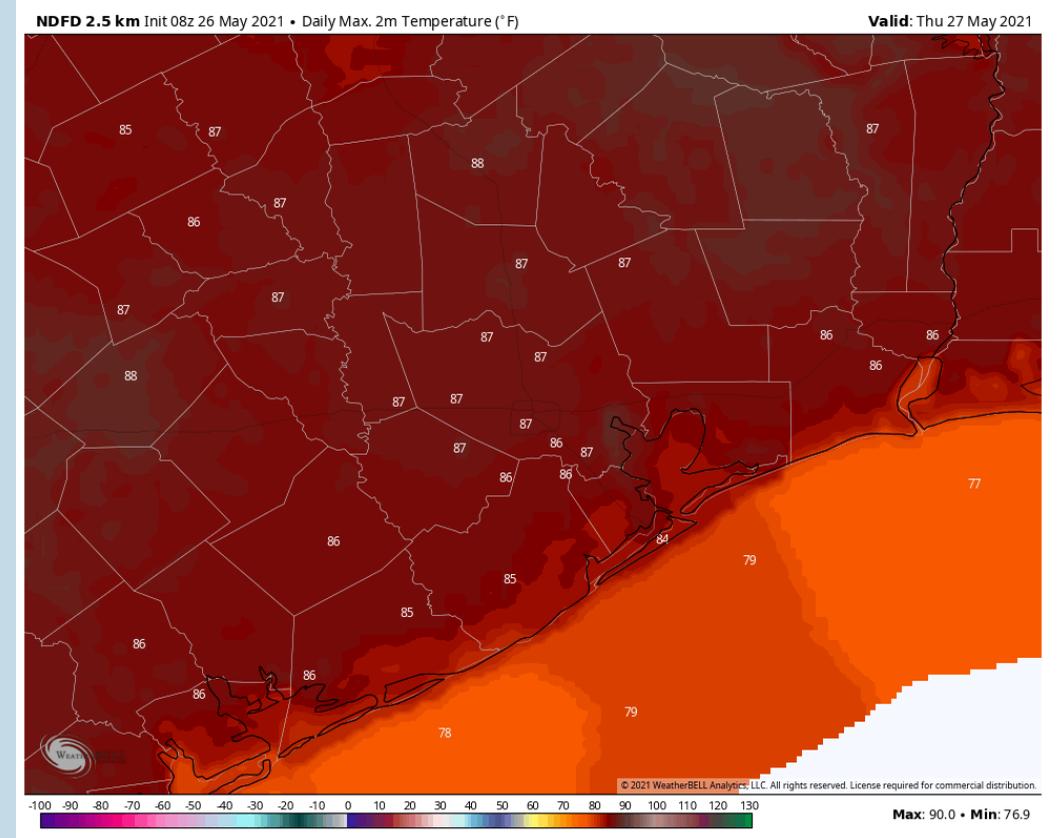

Sustained Winds (3 PM CT)

Simulated Radar Snapshot (10 AM CT)

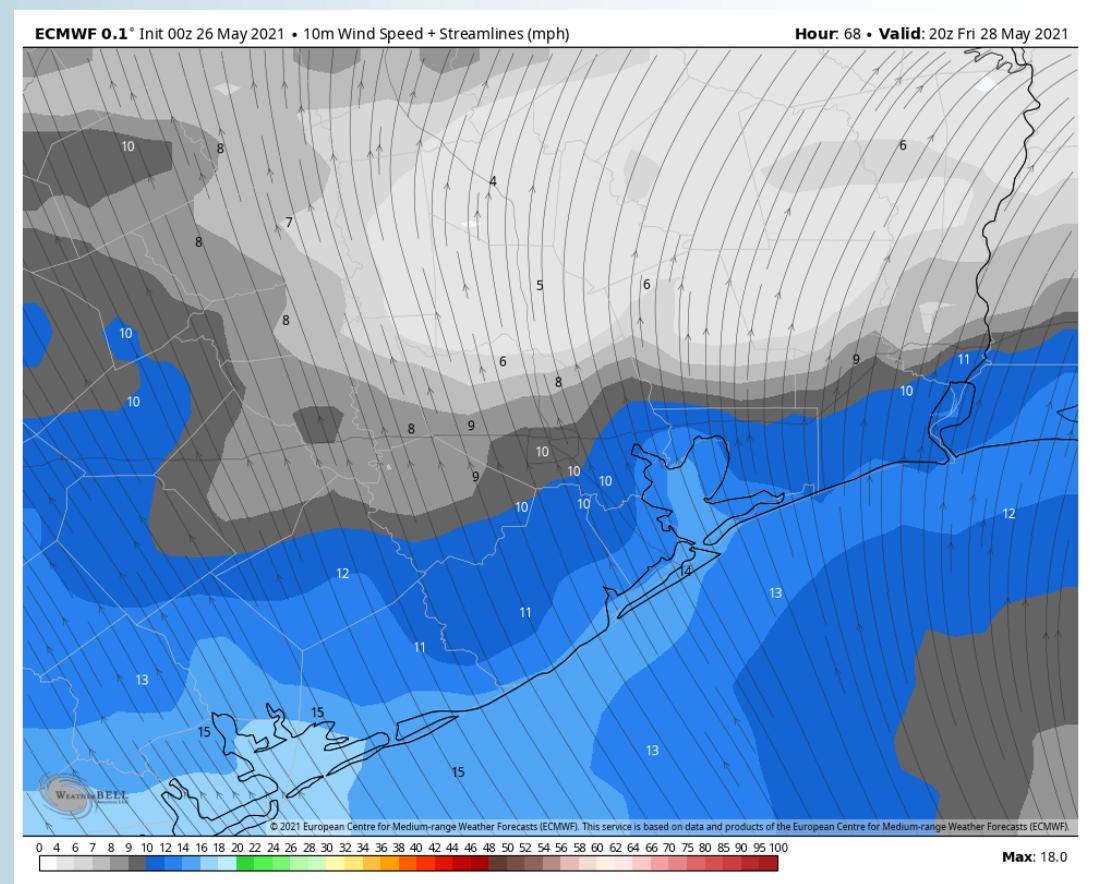

High Temperatures Thursday

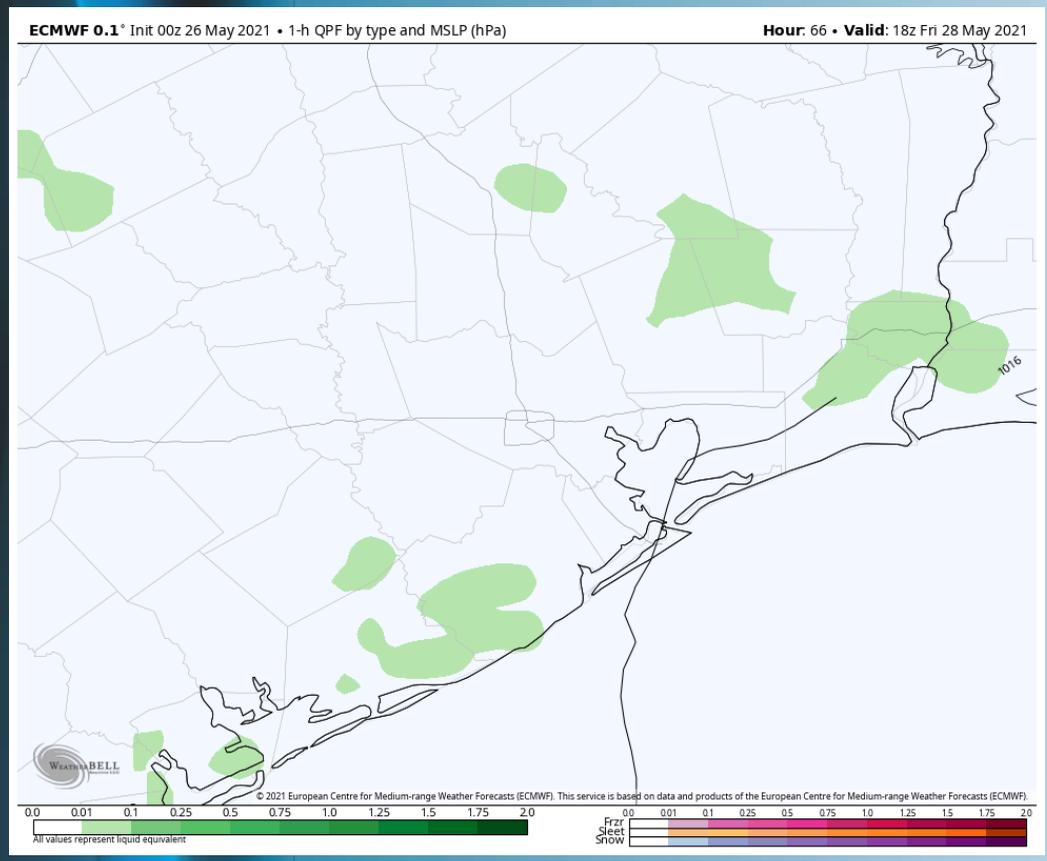

Short-Term Forecast Discussion

- Friday looks to be another generally drier day, but the mention of an extremely isolated shower/ t-storm or two cannot be completely taken out. The best threat to see anything isolated would likely stay a bit further inland.
- Winds will stay consistent into Friday, coming out of the SSE sustained at 10-15 MPH with gusts locally higher.
- Temps will also stay rather consistent into Friday, near 80 with upper 80s closer to HOU metro.
- *No fog expected Friday.*

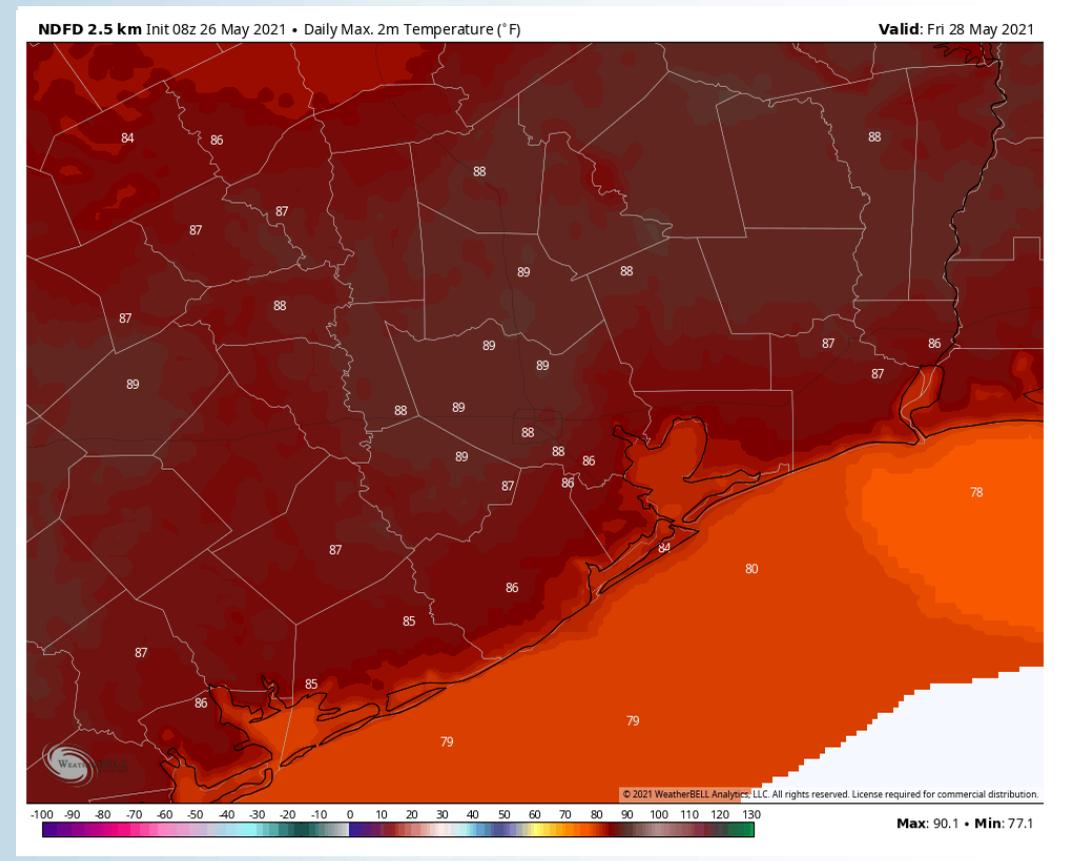

Sustained Winds (3 PM CT)

Simulated Radar Snapshot (1 PM CT)

High Temperatures Friday

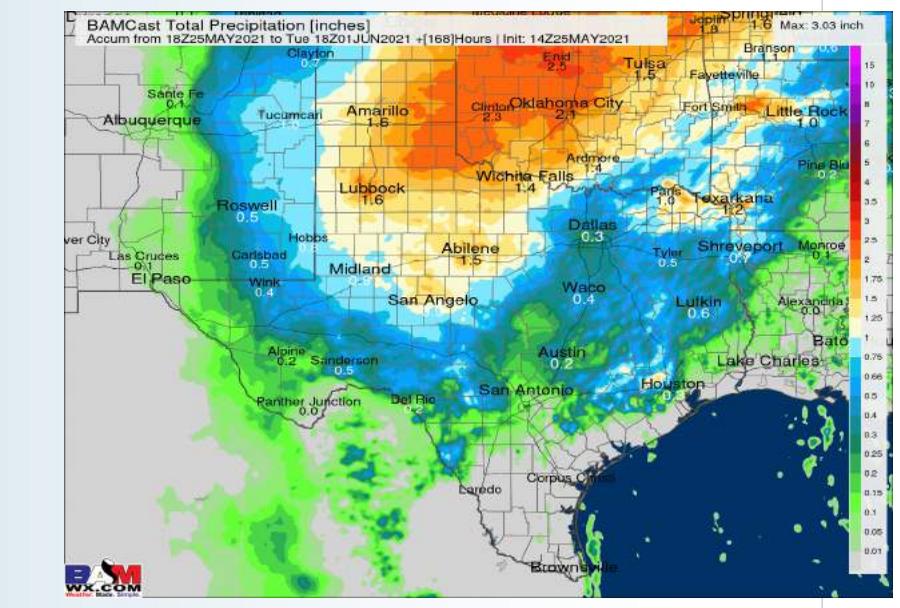

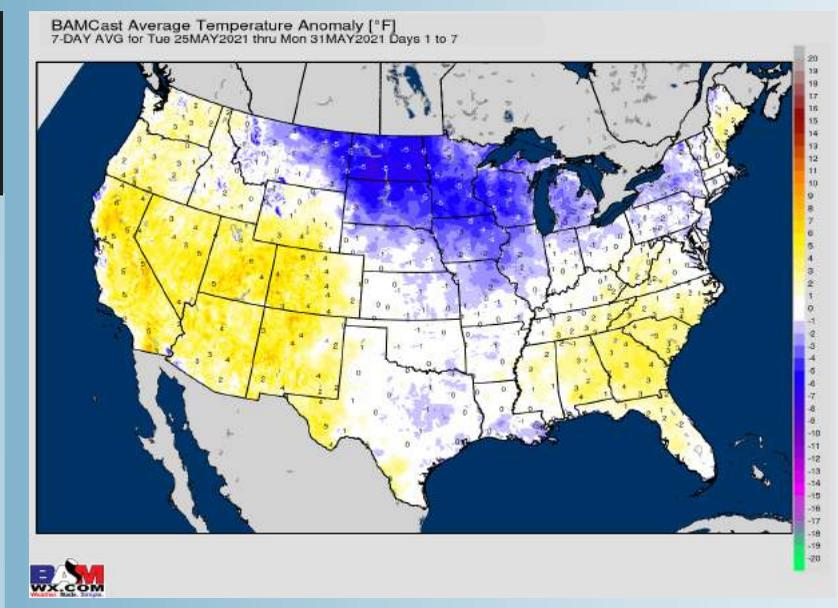

Long-Range Forecast Discussion

- For the next 5-7 days, we favor temps to be right around average for this time of year and our active precip pattern will relax some as we head deeper into this week.

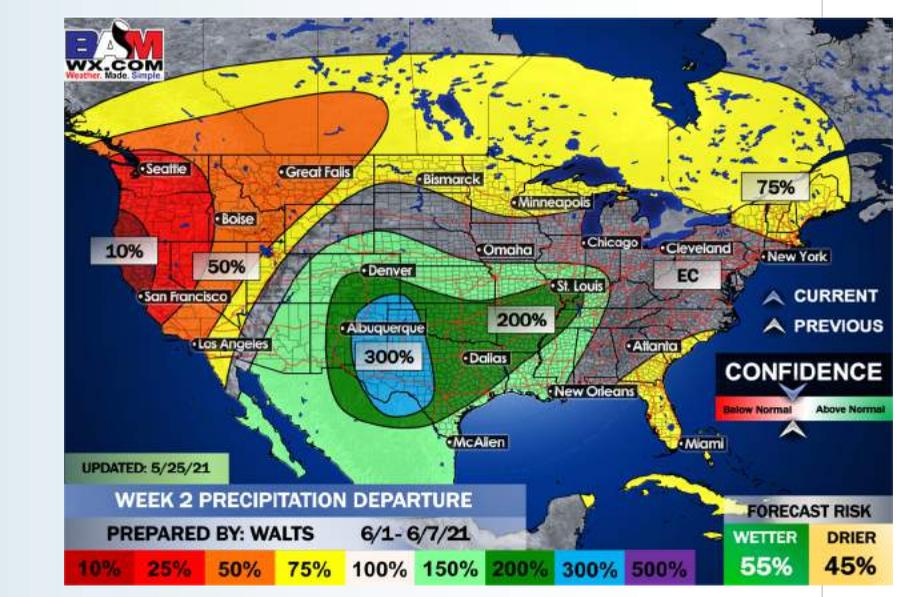

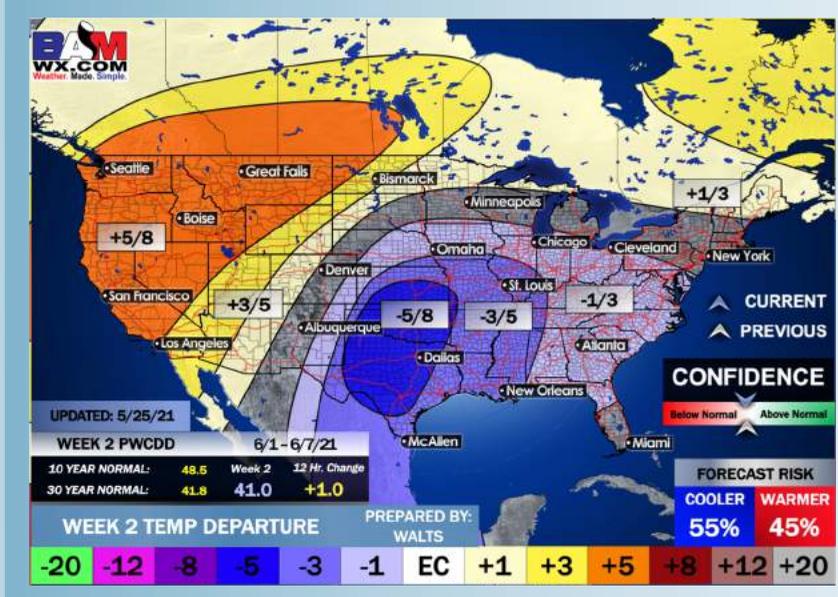

- Working into early June, we are favoring below normal temps for this time of year and for precipitation to stay on the active side of things. Increased moisture risks likely continue across the Southern US.

- The weeks $\frac{3}{4}$ (early to mid June) period likely features more cooler than normal temperatures and above normal moisture, similar to our current week 2 thoughts.
