Short-Term Forecast Discussion

- Isolated chances (~30%) of showers/ thunderstorms will be possible this morning before better chances look to arrive in the afternoon. After ~2 PM, chances look to increase around the area and scattered showers/ thunderstorms look likely. A few locally stronger storms will be possible with heavy rain and locally stronger winds would be the two main threats. The N half of our stations looks to have slightly higher PM percentages than the S stations.
- Today continues winds generally coming out of the SSE (a bit more variable this AM however), sustained 8-13 MPH with gusts locally higher. Stronger wind gusts of 25-35+ MPH will be possible only under the heaviest/ strongest cells in the afternoon.
- Today is another day expected to feature lower 80s as highs for our stations.
- *No fog expected, but reduced visibility will be possible under any locally heavier precip.*

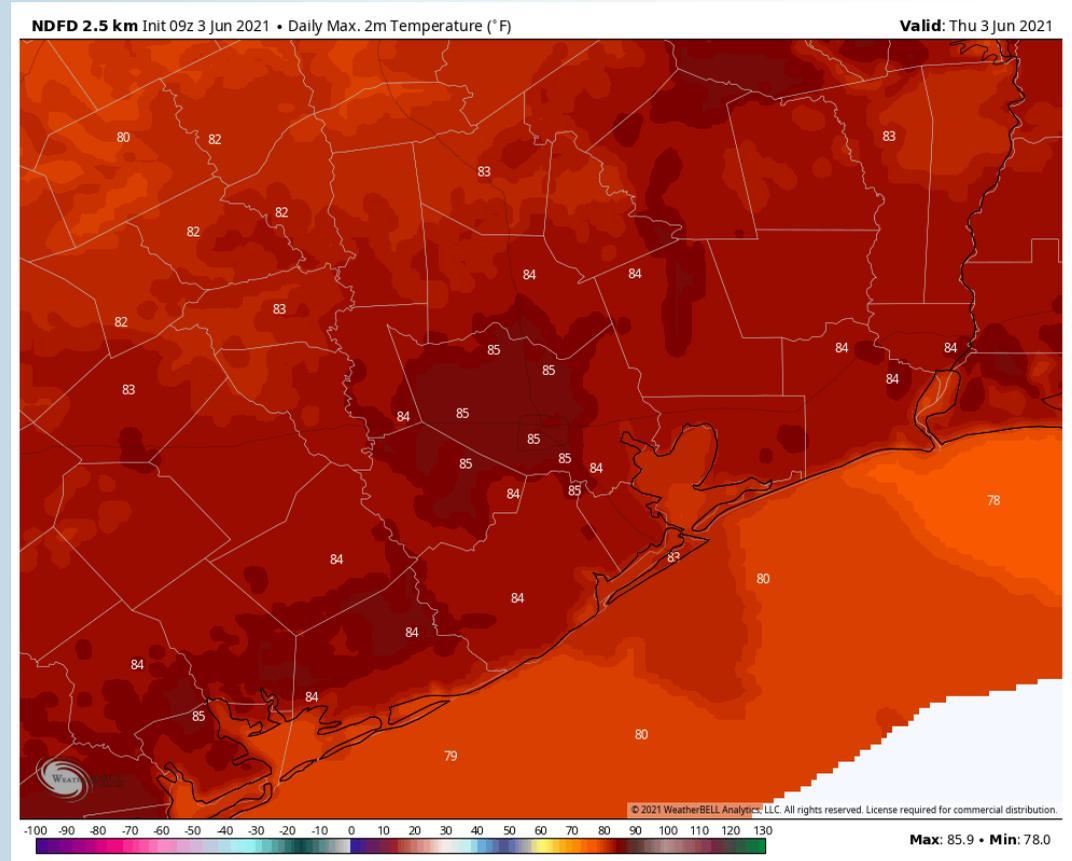

Sustained Winds (4 PM CT)

Simulated Radar Snapshot (2 PM CT)

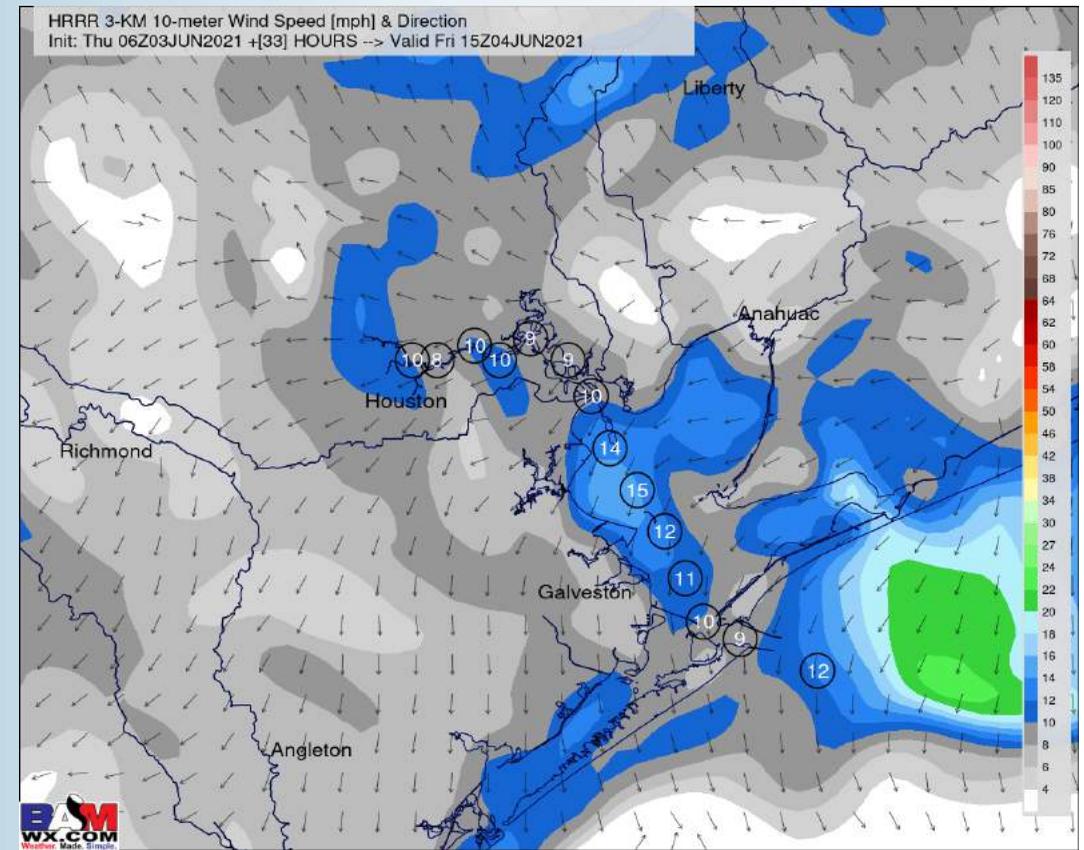

High Temperatures Today

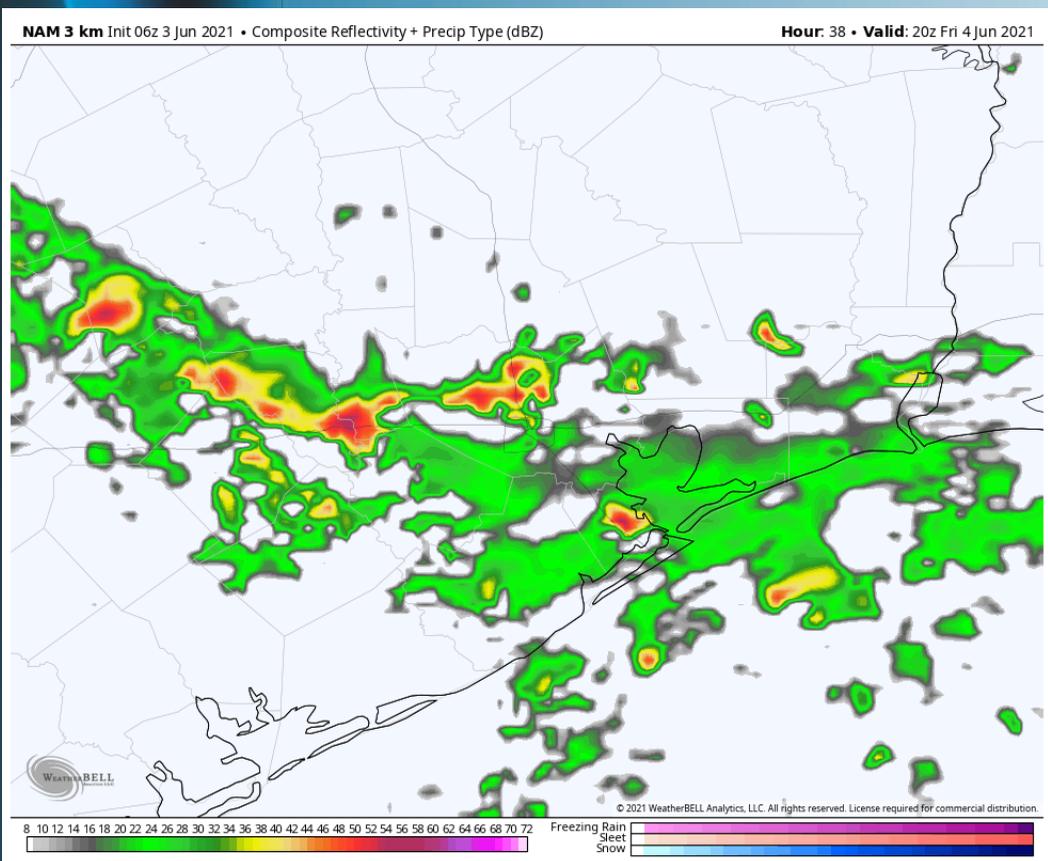

Short-Term Forecast Discussion

- Friday will be yet another day that holds precipitation chances, expecting scattered showers and storms to linger around the area in a scattered fashion for most of the day. Guidance is hinting that mid-day may hold slightly better chances for more organized activity that includes the threat of a stronger cell or two.
- Winds the first half of the day look to be variable in direction and 5-10 MPH sustained. The afternoon hours may see a slight uptick in winds, 8-13 MPH with gusts to 15 MPH possible (locally stronger winds will be possible yet again within the strongest precipitation). There is also a touch lower confidence on exact direction in the PM, but currently would favor a wind coming out of the E.
- Friday continues our pattern of high temps in the lower 80s.
 - *No fog expected Friday.*

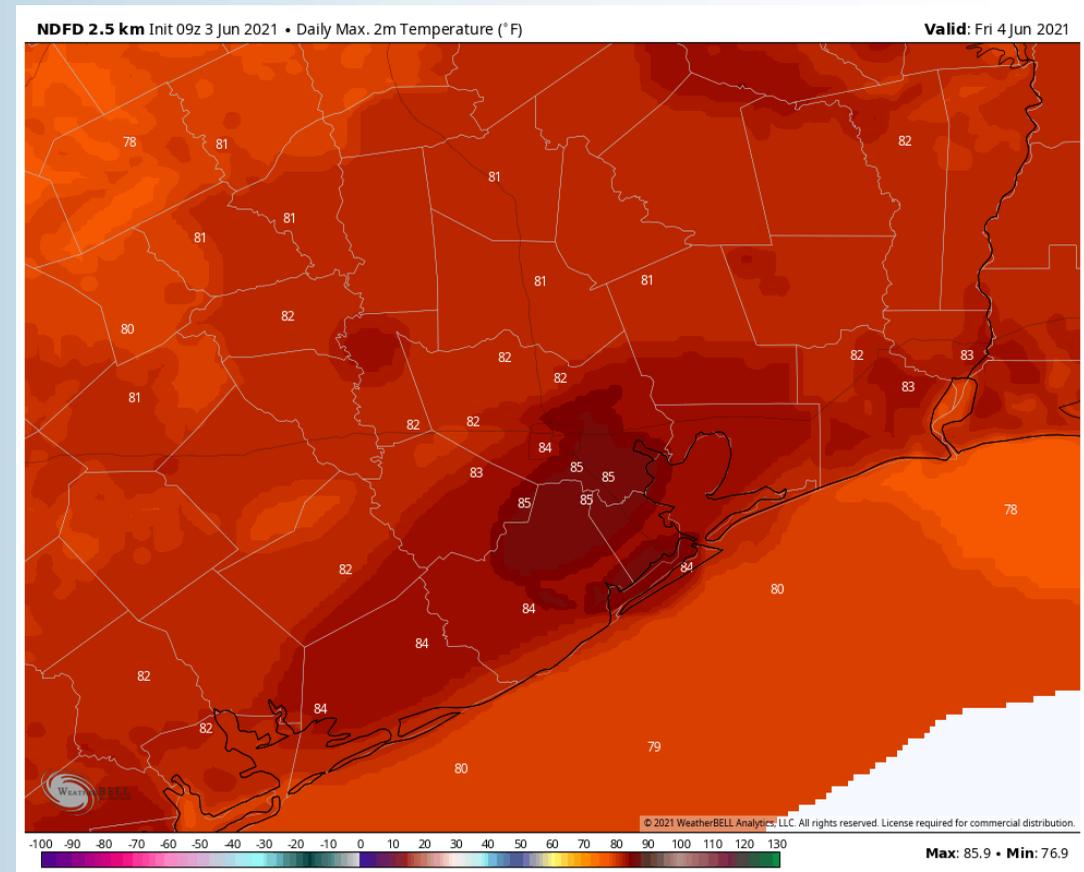

Sustained Winds (10 AM CT)

Simulated Radar Snapshot (3 PM CT)

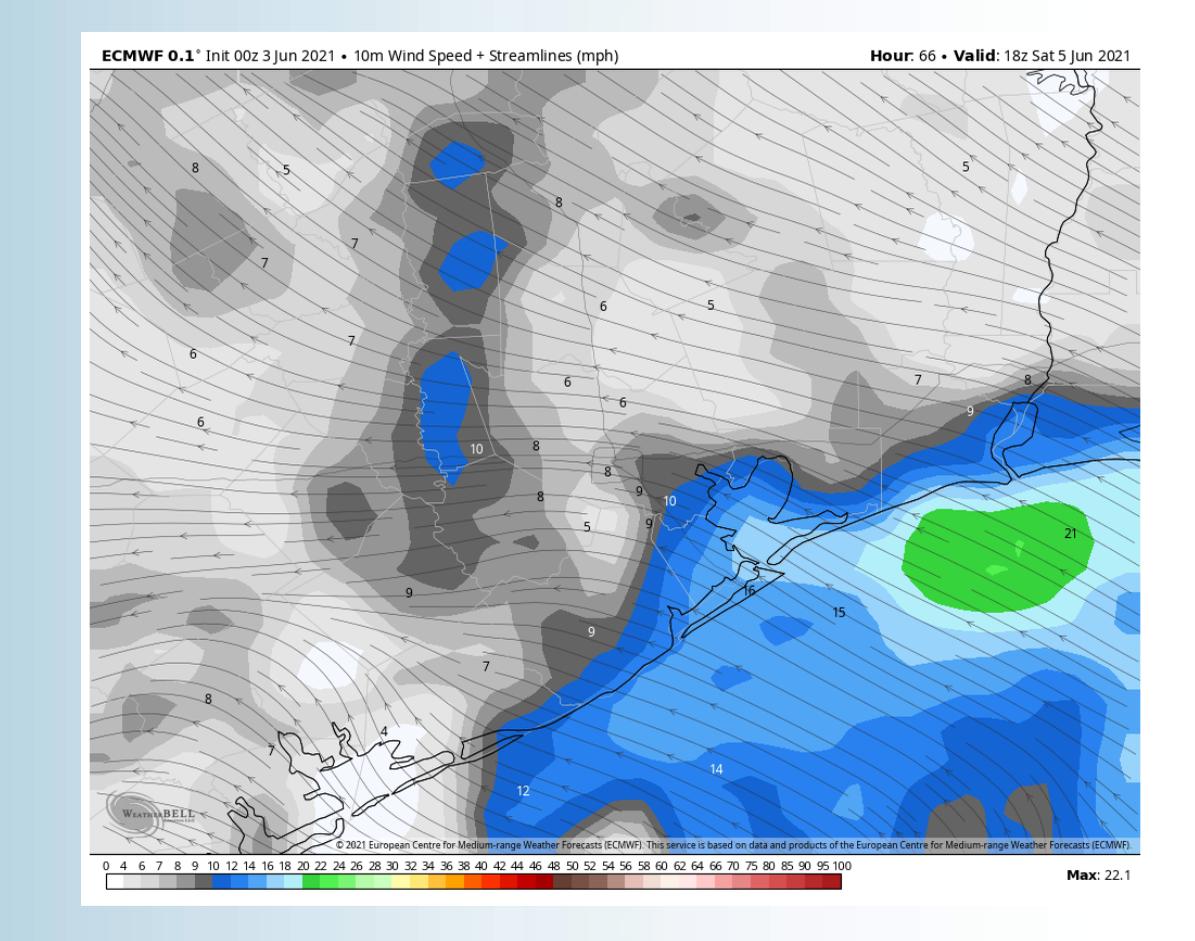

High Temps Friday

Short-Term Forecast Discussion

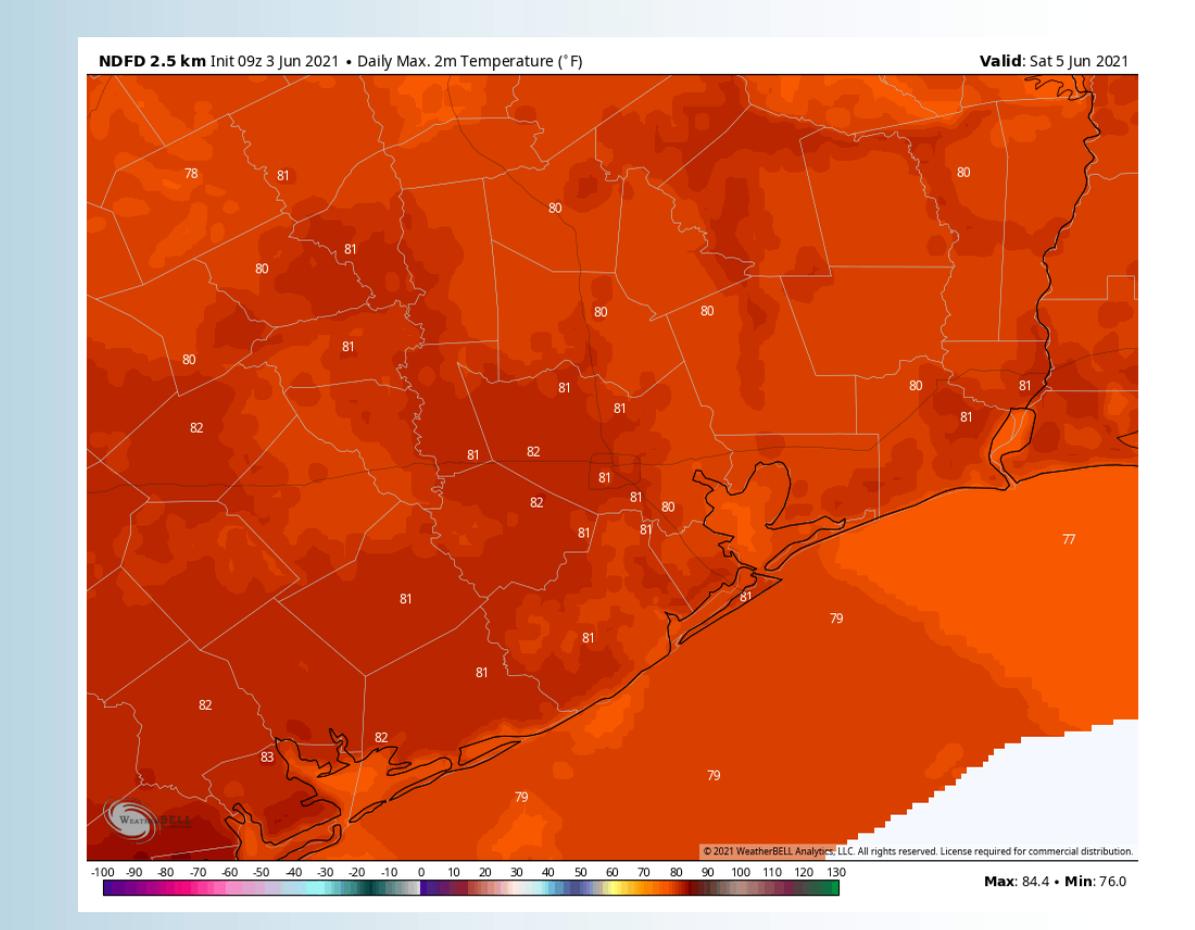

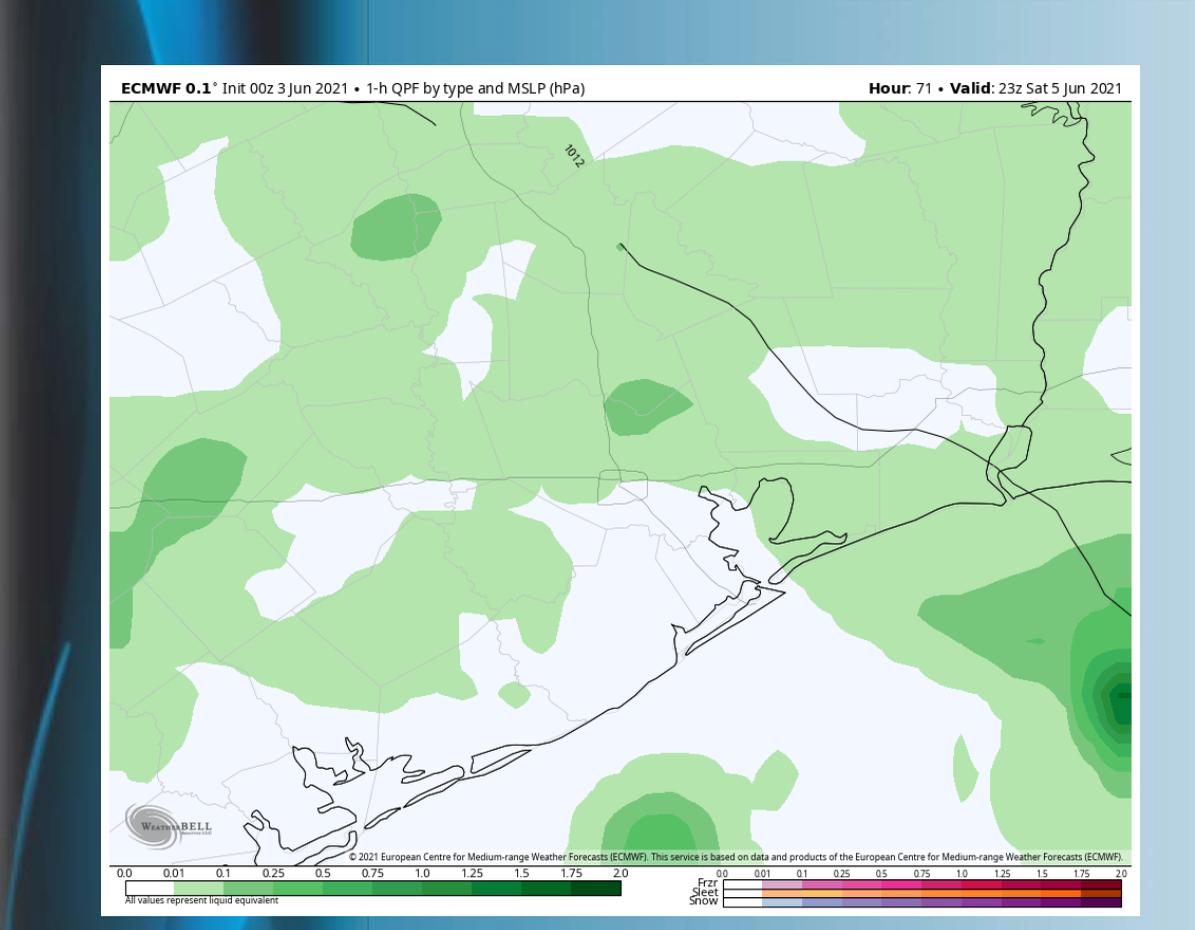

Sustained Winds (1 PM CT)

- Moisture chances continue into Saturday when scattered showers/thunderstorms will hang around the area. Not looking to be a complete washout with non-stop rain, but hit and miss chances looking possible for a good chunk of Saturday.
- Saturday's winds look to be a bit elevated, currently in favor of a SE wind that is 10-15 MPH sustained with gusts 15-20 MPH possible for the first half of the day. Winds look to increase heading later into the afternoon to 15-20 MPH sustained with gusts locally higher
- Saturday looks to sit right around the 80 degree mark for high temps.
 - *No fog anticipated Saturday.*

Simulated Radar Snapshot (6 PM CT)

High Temps Saturday

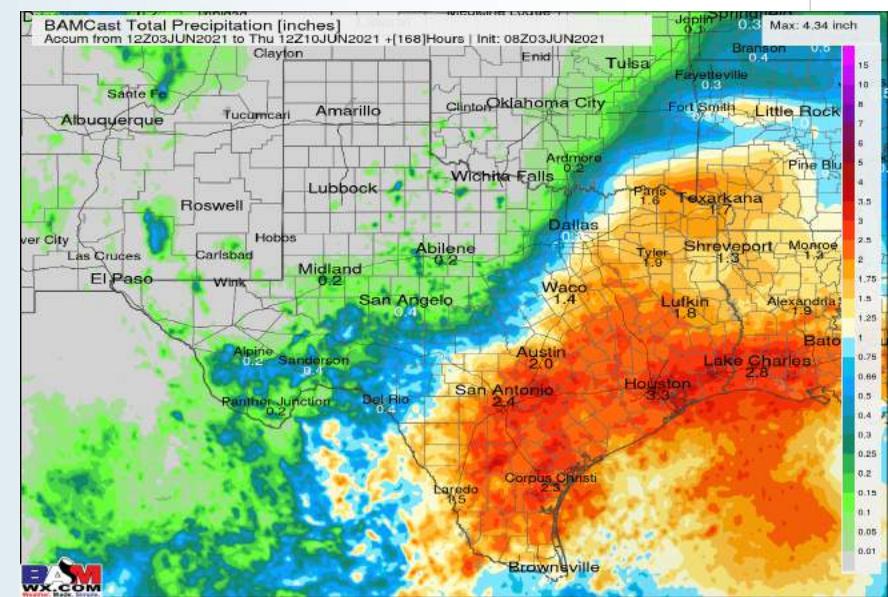

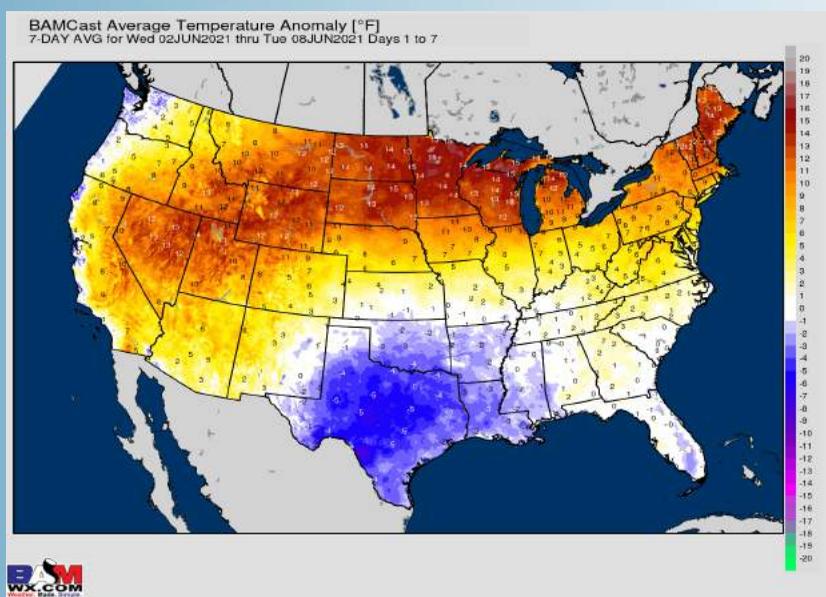

Long-Range Forecast Discussion

- SE TX will be under the influence of the subtropical jet the next 7 days. This will lead to increased rain chances and below normal temperatures the next 7 days. Precipitation chances will continue to remain elevated heading into the weekend and early next week

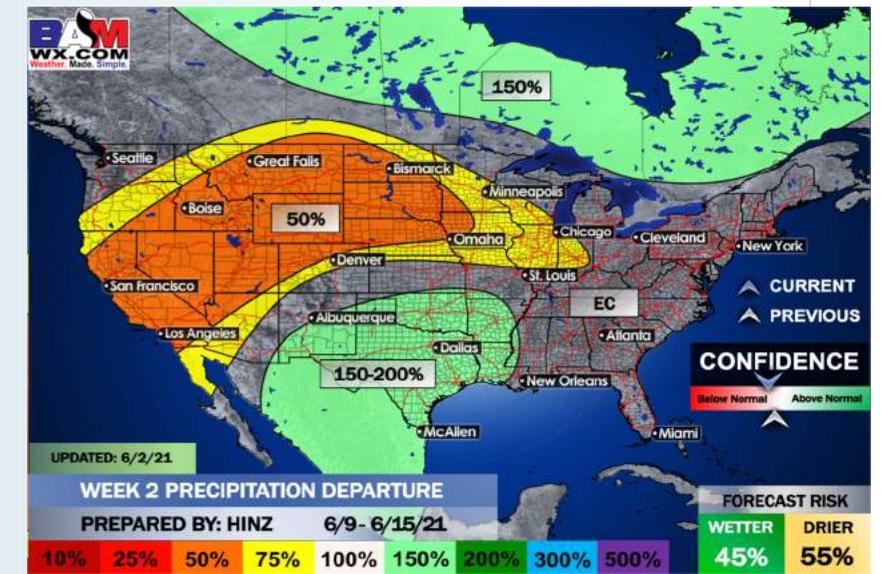

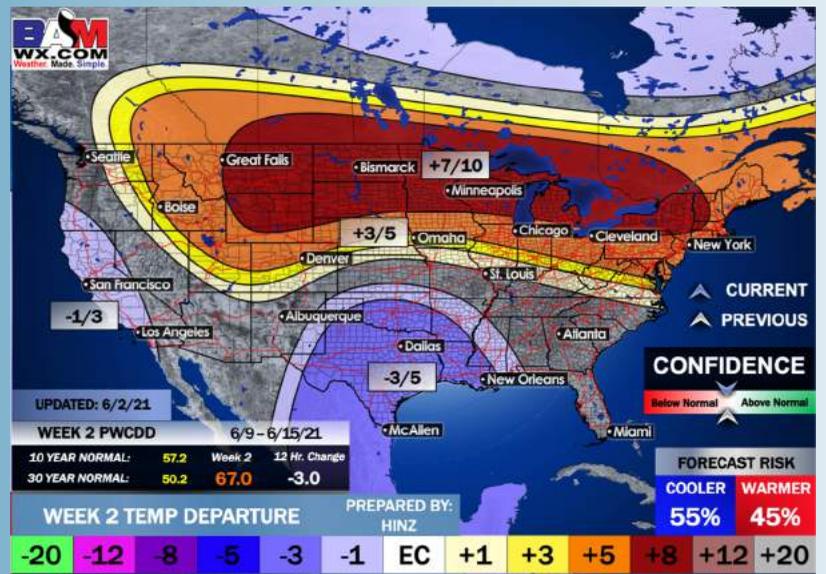

- Working into mid June, we are favoring below normal temps for this time of year and for precipitation to stay on the active side of things. Increased moisture risks likely continue across the Southern US.

- The weeks 3/4 (mid to late June) period likely features more cooler than normal temperatures and above normal moisture, similar to our current week 2 thoughts.
